

COMPUTATIONAL PHYSICS
PHYS-GA-2000, Fall, 2016
Tues & Thurs 12:30-1:45
Room 333 Meyer Hall

Professor:

Andrew MacFadyen
Office: 505 Meyer Hall
am193@nyu.edu

Teaching Assistant:

Geoff Ryan
Office: 538 Meyer Hall
gsr257@nyu.edu

Recitation is required:

Wednesdays 11-12:15 in 333 Meyer

Class assignments will be submitted through github:

<https://github.com/nyu-compphys-2016>

Text Books:

Required:

“Computational Physics” by Mark Newman (2013) ISBN 978-148014551-1

Uses Python for basic topics in computational physics.

Recommended:

“Numerical Recipes: The Art of Scientific Computing” by W. Press et al (Cambridge University Press)

Classic text with explanation and coded examples of useful algorithms.

“Computational Gas Dynamics” by Culbert B. Laney (Cambridge University Press)

Excellent text on computational hydrodynamics, useful for class project.

“Computational Physics” by J. M. Thijssen (Cambridge University Press)

Covers condensed matter topics including lattice computations and Monte Carlo methods.

Topics (subject to change):

Week 1: Introduction to computational physics, getting setup with Python, some basics

Week 2: Numerical Integrals and Derivatives

Week 3-4: Solving Linear and Non-linear Equations

Week 5-6 Fourier Transforms and Spectral Methods

Week 6-7 Ordinary Differential Equations

Week 7-10 Partial Differential Equations

Week 10-11 Monte Carlo Methods

Week 12-13 Advanced topics & work on class projects

Week 14-15 Class presentations

Grading:

Will be based on correct solution of the ~6 bi-weekly class assignments (60%) and on the final course project write-up and presentation (40%).

- Python: Almost all of the coding in the class will be in Python. It is a very forgiving language, quick to learn, and ubiquitous in science and industry. To get set up quickly we recommend the Anaconda distribution, which comes with many useful scientific libraries: <https://www.continuum.io/downloads>. We'll be working with Python 2.7. There are many great learning python resources online, this is particularly good: <http://learnpythonthehardway.org/book/>. It also has sections on learning to use the shell/command line, which we'll be doing a lot of!

- git: 'git' is version control software, a tool that saves different versions of a project, allowing you to easily back up your work, merge different branches of development, and distribute your work. All homework will be submitted using git, so you'll get used to it fast! <https://github.com/> has a tutorial, links to the software itself, and will be hosting your "repos" during the semester.

- LaTeX: LaTeX is, of course, the typesetting program used to make scientific papers in physics, math, and many other disciplines. Your homework write-ups and final project will be in LaTeX. If you don't already have it, the package and some introductory materials are here: <https://www.latex-project.org/>.
